# Pascal's Triangle

# Pascal's Triangle

# Pascal's Triangle Recursion

- ▷ Assume we want to compute the element in  $n^{\text{th}}$  row and  $k^{\text{th}}$  column.
- ▷ In row  $i$  ( $0 \leq i \leq n$ ),
  - There are  $i+1$  columns ( $0 \dots i$ )
  - 0-th column is 1
  - $i$ -th column is 1
  - Otherwise  $j$ -th column ( $0 < j < i$ ) is equal to the sum of the upper element and upper left element.

# Solving Pascal's Triangle

## First Approach: Recursive Functions

- ▷ Write a recursive function that computes the element in n-th row and k-th column of pascal's triangle.
- ▷  $f(n, k)$  is the number of n-th row and k-th column of pascal's triangle ( $0 \leq k \leq n$ ).

$$f(n, k) = \begin{cases} 1 & k = 0 \text{ or } n \\ f(n-1, k) + f(n-1, k-1) & \text{otherwise} \end{cases}$$

- ▷ Compute the runtime of  $f(n, k)$  for various  $n$  and  $k$ , does memoization helps for this function?

# Solving Pascal's Triangle

## Second Approach: Loops

- ▷ Instead of using a recursive function, use loops and 2d arrays to compute the  $f(n, k)$ .
- ▷ Compute the runtime of  $f(n, k)$  for various  $n$  and  $k$ , compare it with the first approach

$$f(n, k) = \begin{cases} 1 & k = 0 \text{ or } n \\ f(n-1, k) + f(n-1, k-1) & \text{otherwise} \end{cases}$$

# Solving Pascal's Triangle

## Third Approach: Combinatorics

$$f(n, k) = \begin{cases} 1 & k = 0 \text{ or } n \\ f(n-1, k) + f(n-1, k-1) & \text{otherwise} \end{cases}$$

$$f(n, k) = \binom{n}{k} = \frac{n!}{k!(n-k)!}$$

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1}$$

- Use factorial to compute this expressions, compute the runtime for various n and k. Compare the 3 approaches. Which one is faster?
